NTP - date and time

Synchronize date and time

Installation

- Synchronize date and time between the physical machine and the VMs running on your system:

```
# apt-get update
# apt-get install ntp
```

- Check whether the correct date and time, and the connection to a time server, has been established:

```
# date
# ntpq -p
```

Troubleshooting

- If you run *ntpq -p* and you get

```
No association ID's returned
```

- Run

```
# dpkg-reconfigure ntp
```

- And then again

```
# ntpq -p
```

Change the timezone of your linux box

```
# dpkg-reconfigure tzdata
```

You need to restart the apache2 service for php to recognize the changed timezone.
