XFCE display manager

Auto login

```
# vim /etc/lightdm/lightdm.conf
[SeatDefaults]
autologin-user= # enter default user
autologin-user-timeout=0 # no of seconds before default user is logged in
```

Make sure it is in Section [SeatDefaults] and not in the section that starts with # Seat Defaults. Restart lightdm after you edit the file.

```
/etc/init.d/lightdm restart
```

Modify shell defaults

```
vim ~/.bashrc
```

Enable terminal colors in the file. Do this for your normal user and the root user.

Fix Gparted installation

```
apt-get install gksu
cp /usr/share/applications/gparted.desktop ~/.local/share/applications/
```

Modify the command which starts gparted from the desktop environment:

```
gparted-pkexec --> gksudo gparted
```

Default desktop

To reinstall the default desktop background image, navigate to

```
/usr/share/images/desktop-base
```

and choose the joy-wallpaper.svg with the resolution of your screen
