Access template parameters in component's tmpl override

```
class JAddons{
static public function getTplParams(){
    $app =& JFactory::getApplication();
    $cont = null;
    $ini   = JPATH_THEMES.DS.$app->getTemplate().DS.'params.ini';
    $xml   = JPATH_THEMES.DS.$app->getTemplate().DS.'templateDetails.xml';
    jimport('joomla.filesystem.file');
    if (JFile::exists($ini)) {
        $cont = JFile::read($ini);
    } else {
        $cont = null;
    }
    return new JParameter($cont, $xml, $app->getTemplate());
}
}
```

Load the class:

```
$app =& JFactory::getApplication();
JLoader::register('JAddons',
JPATH_THEMES.DS.$app->getTemplate().DS.'read_tpl_params.php');
```

Get the parameter:

```
$some_param_val  = JAddons::getTplParams()->get('some_param');
```
